The present sequence is that of novel human immunomodulator PR0240 (UW0214) as deduced from cDNA (see AAR30054) isolated from a foetal liver library. PR0240 (25 kDa, pl 7.83) shows sequence homology to chicken C-serrate-1 and Droscophila serrate precursor protein. Expression confident control of the contr

The present invention relates to PRO proteins and coding sequences. The present sequence is one such PRO protein. It was found that the PRO genes are amplifited in the genome of tumour cells. The gene amplification is expected to be associated with the overexpression of the gene product and contributes to tumourigenesis. Therefore, antagonists of PRO proteins are useful for the treatment of benign or malignant tumours, leukaemias, lymphoid malignancies and other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, epithelial, inflammatory and immunologic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          121

```

The present sequence is that of human transforming growth factor alpha HIII (TGF alpha HIII), a novel member of the TGF family. The amino acid sequence was deduced from a cond close AsA2166) discovered in a human testis cDNA library. The invention provides TGF alpha HIII mucleic acid molecules and polypeptides (including the mature protein, full-closed protein, variants and homologues), vectors, host cells, antibodies and recombinant methods for producing the polypeptides. The TGF alpha HIII polypeptides and polynucleotides can be used in diagnostic methods for detecting disorders related to TGF alpha HIII, and also for therapeutic purposes, e.g. to stimulate wound healing to restore normal neurological functioning after trauma or AIDS dementia, to treat coular disorders, to target certain cells, to treat kidney and liver disorders, to target certain cells, to stimulate angiogenesis for the treatment of burns, ulcers and corneal incisions, and to stimulate colls, allergic reactions, cardiovascular diseases, organ rejection, and hyperproliferative disorders may also be treated. Methods are also provided for identifying agonists and antegonists of TGF alpha HIII. Antegonists may be used to inhibit the action of TGF alpha HIII polypeptides in the treatment of corneal inflammation, neoplasia tumours and cancers, and psoriasis such

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .0-MAR-
                                                                                                                                    This invention relates to the cDNA and protein sequences of novel secreted and transmembrane polypeptides PRO polypeptides. The invention also comprises a method for producing the proteins of the invention by recombinant means and antibodies specific for the protein of the invention. The antibody may be used for detecting the PRO proteins of the invention and may be used to modify their activity. Polymcleotides may be used as hybridisation probes for a cDNA library to isolate the full-length PRO cDNA or to isolate other cDNAs, to construct hybridisation probes for mapping the gene which encodes that PRO and for genetic analysis of individuals with genetic disorders, in assays to identify other proteins or molecules involved in binding reaction, to generate transgenic animals or knock-out animals which in turn are useful in the transgenic animals or knock-out animals which in turn are useful in the useful in gene therapy, and and Lissue typing. The PRO polypeptides are useful in gene therapy, and an molecular weight markers for protein electrophoresis purposes. The sequences may also be used to detect overexpression on PRO polypeptides in cancerous tumours and for screening for differentially expressed genes using microarray technology. The present sequence represents a human PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               112
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          181

#### GENENTECH INC (GETH )

Henzel W, Kabakoff RC; Gurney AL, Hebert C, Watanabe CK, Wood WI; Baker KP, Goddard A, Shelton DL, Smith V,

## WPI; 2003-328851/06 N-PSDB; ACA57990.

Novel isolated PRO polypeptides e.g. PRO240, PRO381, PRO540, useful treating tumor, preferably cancer, or for treating neuronal, glial, hypothalamic, stromal, inflammatory, angiogenic and immunologic disorders.

# Claim 32; Fig 2; 186pp; English.

The invention relates to an isolated secreted and transmembrane polypeptide, designated as PRO polypeptide, PRO polypeptide lacking its associated signal peptide or PRO polypeptide extracellular domain with or without its associated signal peptide. The PRO polypeptide or an antibody binding to it is useful for inhibiting the growth of a tumor cell. A composition containing a PRO polypeptide is useful for inhibiting neoplastic cell growth or for treating a tumour, preferably cancer (such as liver, breast, ovarian, renal, colorectal, uterine, prostate, lung, bladder, gastric, pancreatic, vulval, thyroid, central nervous system

```
cancer, hepatic carcinomas, sarcomas, glioblastomas, melanoma or leukaemia) in a mammal. The PRO polypeptide is useful for identifying its agonists. The PRO polypeptide or an antibody binding to it is useful in the preparation of a medicament for treating a condition which is responsive to the PRO polypeptide or an antibody binding to it. The PRO polypeptide or an antibody binding to it is also useful for treating neuronal, glial, astroytal, hypothalamic, glandular, macrophagal, epithelial, satroyal, hypothalamic, glandular, macrophagal, epithelial, stromal, blastocobic, inflammatory, angiogenic and immunologic disorders. The present sequence represents the amino acid sequence of a PRO polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          132
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          241

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNP-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for colon, breast, prostate, rectal, cervical and liver tumours). The proliferation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymuclectides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful creagents. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for inducing endothelial cell cartilage defects, osteoarthritis and rheumatcid arthritis. This sequence represents a human PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  121

```
The invention relates to an isolated secreted/transmembrane (PRO) polypeptide, having at least 80% sequence identity to a sequence selected from any one of the 57 amino acid sequences given in specification, or to a sequence encoded by a nucleic acid molecule selected from any one of the nucleic acids deposited under any of the ATCC accession numbers given in specification, or a sequence having at least 80% identity to PRO lacking its associated signal peptide, an extracellular domain of PRO with or without its associated signal peptide, an extracellular domain of PRO with or wichout its associated signal peptide. Also included are vectors, transformed host cells, anti-PRO antibodies, the nucleic acids encoding PRO, PRO fusion proteins, inducing endothelial cell tube formation (by administering PRO281, PRO1560, PRO189, PRO6308, PRO6000,
                                                                                                                                                      301
                                                                                                                                                                                                                                                                                                                                                                                 192
                                                                                                                                                                                                                                                                                                                                                                                                                                                          421

Human secreted/transmembrane polypeptide PRO240. 

Human, PRO, secreted protein, transmembrane protein, endothelial cell tube formation; chondrocyte cell differentiation, microvascular endothelial cell; tumour; lung tumour; colon tumour; breast tumour; prostate tumour; rectal tumour; kidney tumour; liver tumour; cytostatic; vaccine.

Homo sapiens

JS2003073196-A1.

DEVELOPMENTAL STAGE: Expressed in the embryonic ventricular zone, the postnatal ependymal cells, and the choroid plexus throughout embryonic and postnatal development.
-!- PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch-derived peptide containing the intracellular domain (NICD) from the membrane.
                                                                                                                                                                                                                                                                                                                                           MEDLINE=21374376; PubMed=1145941;

Following proteolytical processing NICD is translocated to the nucleus.
-: TISSUE SPECIFICITY: Proliferating neuroepithelium.
-: TISSUE SPECIFICITY: Proliferating neuroepithelium.
-:- DEVELOPMENTAL STAGE: CNS development.
-:- DTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a cterminal fragment N(TM) and a N-terminal fragment N(EC): Following ligand binding, it is cleaved by INF-aipha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch derived peptide containing the intracellular domain (NICD) from the membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. -!- FUNCTION: Functions as a receptor for membrane-bound ligands
Upon ligand activation through the released notch intracellular domain (MICD) it forms a transcriptional activator complex with
RBP-J kappa and activates genes of the enhancer of split locus:
Affects the implementation of differentiation, proliferation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     development. SubUNIT: Heterodimer of a C-terminal fragment N(IM) and a N-terminal fragment N(EC) which are probably linked by disulfide

NEUROGENIC LOCUS NOTCH HOMOLOG PROTEIN 1.
NOTCH EXTRACELLULAR TRUNCATION.
NOTCH INTRACELLULAR DOMAIN.

EXTRACELLULAR (POTENTIAL).
an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called
                                                                                                                                                                   notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMBL; 211886; CAA77941.1; --

         Note=No experimental confirmation available;

-INSUE SPECIFICITY: Highly expressed in the brain, lung and thymus. Expressed at lower levels in the spleen, bone-marrow, spinal cord, eyes, mammary gland, liver, intestine, skeletal muscle, kidney and heart.

-IDEVELOPMENTAL STAGE: First detected in the mesoderm at 7.5 dpc By 8.5 dpc highly expressed in presonation mesoderm at 7.5 dpc By 8.5 dpc highly expressed in presonation mesoderm, mesenchyme and endothelial cells, while much lower levels are seen in the neuroepithelium. Between 9.5-10.5 dpc expressed at high levels in the neuroepithelium. At 13.5 dpc expressed at high levels in the neuroepithelium. At 13.5 dpc expressed at nigh levels in the neuroepithelium. At 13.5 dpc expressed at nigh levels in the neuroepithelium. At 13.5 dpc expressed in the surface ectoderm, eye and developing whisker follicles.

-!- PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteclytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDINE-21123790, PubMed=11226752;

The J. Dev. Neurosci. 19:21-35(2001).

Makao M. Maggedla and neurogenesis.";

Int. J. Dev. Neurosci. 19:21-35(2001).

L. FUNCTION: Punctions as a receptor for membrane-bound ligands

Jaggedl, Jaggedla and Deltal to regulate cell-fate determination.

Upon ligand activates genes of the enhance complex with

RBP-J kappa and activates genes of the enhance complex with

RBP-J kappa and activates genes of the enhance of split locus.

Affects the implementation of differentiation, proliferation and

apoptotic programs (By similarity). May play an essential role in

postimplantation development, probably in some aspect of cell

specification and/or differentiation. May be involved in the

maturation of both CD4+ and CD8+ cells in the thymus.

c. SUBGELULAR LOCATION: Type I membrane protein. Following

c. SUBGELULAR LOCATION: Type I membrane protein. Following

proteolytical processing NICD is translocated to the nucleus.

Hereditas 185:89-96 (2002).

Hereditas 185:89-96 (2002).

Deripheral nervous system and eye, wind disk, cogenesis, segmental and negative signals, the differentiation of at least central and peripheral nervous system and eye, wind disk, cogenesis, segmental appendages such as antennae and legs, and muscles, through lateral inhibition or induction. Functions as a receptor for membrane. Computed ilgands Delta and Serrate to regulate cell-fate determination. Upon ligand activation, and releasing from the cell membrane, the Notch intracellular domain (NICD) forms a transcriptional activator complex with Su(H) (Suppressor of hairless) and activates genes of the E(spl) complex. Bssential for proper differentiation of ectoderm.

SUBBUNIT: Interacts with Su(H) when activated. Interacts with Dx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                      SUBCELLULAR LOCATION: Type I membrane protein. Upon activation and S3 cleavage, it is released from the cell membrane and enters into the nucleus in conjunction with Su(H).

PTM: Upon binding its ligands such as Delta or Serrate, it is cleaved (S2 cleavage) in its extracellular domain, close to the transmembrane domain. S2 cleavage is probably mediated by Kuz. It is then cleaved (S3 cleavage) downstream of its transmembrane domain, releasing it from the cell membrane. S3 cleavage requires
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       170 CCCTGTCCTGGAGGTAGTAATGCCTGGGACAATGTTACTTCTTTCAAGGACAAG---

"Human deltex is a conserved regulator of Notch signalling.";

"Human deltex is a conserved regulator of reasserved in the Affects the implementation of differentiation, proliferation and apoptotic programs. May be important for normal lymphocyte function. In altered form, may contribute to transformation or progression in some T-cell neoplasms. Involved in the maturation of both CD4+ and CD8+ cells in the thymus (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TISSUE SPECIFICITY: In fetal tissues most abundant in spleen, brain stem and lung. Also present in most adult tissues where it is found mainly in lymphoid tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            β

Suppression.

Suppression.

Comparison of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide bonds (By similarity).

Subcellular location. Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.

Comparison of the processing NICD is translocated to the nucleus.

Comparison of the processing NICD is translocated to the nucleus.

Comparison of the processing NICD is translocated to the nucleus.

Comparison of the processing NICD is translocated to the nucleus.

Comparison of the processing NICD is translocated to the nucleus.

Comparison of the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furni-like convertase in the convertion interminal fragment N(EC). Following interminal fragment N(EC). Following Ingand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).

Comparison of the membrane (By similarity).

SIMILARITY: Contains 3 Lin/Notch repeats.

SIMILARITY: Contains 3 Lin/Notch repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright.                Jagged1, Jagged2 and Deltai to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) if forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and appoptotic programs (By similarity). Acts instructively to control the cell fate determination of CNS multipotent progenitor cells, resulting in astroglial induction and neuron/oligodendrocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for membrane-bound ligands

-!- FUNCTION: Ligand for Notch receptors and involved in the mediation of Notch signaling (By similarity). Seems to be involved in cell-fate decisions.
-!- SUBCELLULAR LOCATION: Type I membrane protein (Probable).
-!- SIMILARITY: Contains 17 EGF-like domains.
-!- SIMILARITY: Contains 1 DSL domain.
-!- SIMILARITY: Contains 1 VWFC domain.

"Human ligands of the Norch receptor.";
Am. J. Pathol. 154-785-794(1999).
-!- FUNCTION: Functions as a receptor for membrane-bound ligands
Jagged1, Jagged2 and Deltal to regulate cell-fate determination.
Upon ligand activation through the released notch intracellular
domain (NICD) it forms a transcriptional activator complex with
RBP-J kappa and activates genes of the enhancer of split locus.

TISSUE SPECIFICITY: Highly expressed in the heart, moderately in the lung and placenta and at low levels in the liver, skeletal muscle, kidney, pancreas, spleen, lipwin node, thymus, bone marrow and fetal liver. No expression was seen in adult brain or peripheral blood leukocytes.

-!-PRM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(EC). Following ligand-accessible form. Cleavage results in a C-terminal fragment N(EC). Following control bidding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentilin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (see http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
Affects the implementation of differentiation, proliferation and apoptotic programs. May regulate branching morphogenesis in the developing vascular system (By similarity).

SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide bonds (By similarity).

SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus.

ALTERNATURE RODUCTS:
                                                                                                                                                                                                                                    Event=Allernative splicing, Named isoforms=3; Comment=Experimental confirmation may be lacking for some
                                                                                                                                                                                                                                                                                                                                                                                                      IsoId=299466-2; Sequence=VSP_001406;
                                                                                                                                                                                                                                                                                                                                                 IsoId=Q99466-1; Sequence=Displayed;

Molecular cloning of the large subunit of transforming growth factor

type beta masking protein and expression of the mRNA in various rat

type beta masking protein and expression of the mRNA in various rat

T type beta masking protein complex of TGF-betal from platelets is

composed of the TGF-betal molecule noncovalently associated with

a masking protein consisting of a disulfide-bonded complex of a

dimer of the N-terminal propeptide of the TGF-betal precursor and

a masking protein consisting of a disulfide-bonded complex of a

dimer of the N-terminal propeptide of the TGF-betal precursor and

a third component denoted TGF-betal-BP (or MP large subunit).

TGF-betal-Dp does not bind directly to active TGF-betal.

-!- SUBCELLULAR LOCATION: Secreted.

-!- SIMILARITY: Contains 18 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        POTENTIAL.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
